Fatent No. 6300109

Fatent No. 6300109

GENERAL INFORMATION:

APPLICANT:
TITLE OF INVENTION: restriction-modification systems from Lactococcus lactis
NUMBER OF SEQUENCES: 14

COMPUTER READABLE FORM:

MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC compatible

OPERATING SYSTEM: PC-DOS/MS-DOS

SOFTWARE: PatentIn Release #1.0, Version #1.30 (EPO)

CURRENT APPLICATION DATE:

i Sequence 6846, Application US/09949016

j Patent No. 6812339

j GENERAL INFORMATION:

APPLICANT: VENTER, J. Craig et al.

TITLE OF INVENTION: POLYNORPHISMS IN KNOWN GENES ASSOCIATED

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

TITLE OF INVENTION: WITH HUMAN DISEASE, METHODS OF DETECTION AND USES THEREOF

CURRENT FILING DATE: 2000-00-01-14

PRIOR PELICATION NUMBER: 60/231,768

PRIOR PELING DATE: 2000-10-03

PRIOR PELING DATE: 2000-10-03

PRIOR PELING DATE: 2000-10-03

PRIOR PELING DATE: 2000-09-08

NUMBER OF SEQ ID NOS: 207012

SOFTWARE: PASESEQ for Windows Version 4.0

SEQ ID NO 6846

LENGTH: 609

TYPE: PRT

CORGANISM: Human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

```
The invention relates to an isolated antibody (Ab), and its functional fragments, that bind to human insulin-like growth factor-1 receptor (IGF-IR) and optionally: (i) inhibit natural binding of insulin-like growth factors (IGF)-1 and/or -2; and/or (ii) inhibit specifically tyrosine kinase activity of IGF-IR. Ab and its fragments are used to prevent or treat diseases associated with overexpression and/or abnormal activity of IGF-IR and/or receptor (EGFR) and/or with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cytostatic; antipsoriatic; antibody; insulin-like growth factor-1 receptor; IGF-1R; tyrosine kinase activity; or epidermal growth factor receptor; BGFR; signal transduction pathway; ligand; tumor; cancer; osteosarcoma; complementarity determining region;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New antibodies that bind to human insulin-like useful for treatment, prevention and diagnosis
                                                                                                                                                                                                                                                                                                                                                                     ALIGNMENTS

growth factor receptor, of cancers.

```
ö
hyperactivity of signal transduction pathways mediated by interaction of these receptors with their ligands. Especially they inhibit transformation of normal cells to tumor cells, inhibit growth and/or proliferation of tumor cells so are useful against cancers of the prostate, lung, breast, endometrium and colon, also osteosarcoma, and also for treating psoriasis. Ab are also used to diagnose diseases caused by abnormal expression of IGF-IR and/or EGFR. This sequence represents an CDR sequence used to generate the Ab of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody (I) or its functional fragment, being capable of binding to human IGF-IR and, if necessary, capable of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          neoplasm; prostate tumor; andrology; genitourinary disease; osteosarcoma; musculoskeletal disease; respiratory disease; lung tumor; endocrine disease; gynecology and obstetrics; breast tumor; endometroid carcinoma; gastrointestinal disease; colon tumor; antipsoriatic; psoriasis; dermatological disease; immune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel isolated anti-insulin-like growth factor I receptor (IGF-IR) antibody or its functional fragment, being capable of binding human IGF-IR and specifically inhibiting tyrosine kinase activity of receptor,

specifically inhibiting tyrosine kinase activity of the receptor, comprising a light or heavy chain having at least one complementary determining region (CDR) consisting of one of two fully defined 16 amino acids (ADD57006 and ADD57014). An antibody of the invention is useful in the preparation of a medicament intended for the prevention or treatment of an illness connected with an overexpression and/or an abnormal activation of the IGF IR and/or EGFR, and/or connected with an overexpression and/or an abnormal continuous secondary effects and/or EGFR, and/or connected with a administration of the transduction pathway of the signal mediated by the interaction of the transformation of normal cells into cells with tumoral receptor. The antibody is useful for preparation of a medicament intended to inhibit the transformation of normal cells into cells with tumoral consideration of a medicament intended to inhibit the growth and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent and/or EGF-dependent cells, preferably IGF-dependent and/or IGF-dependent and/or IGF-dependent and/or EGF-dependent and/or EGF-dependent cells. (I) is useful in the preparation of a medicament intended for intended for prevention or for the treatment of cancer, the cancer is chosen from prostate cancer, osteosarcoma, lung cancer, the cancer is chosen from prostate cancer, osteosarcoma, lung cancer, the cancer is chosen from prostate cancer, osteosarcoma, lung cancer, creatment of psoriasis. (I) is useful in preparation of a medicament intended for the prevention or for the prevention or for the creatment of psoriasis. (I) is useful in preparation of a medicament intended for the prevention or an underexpression of the IGF-IR and/or EGFR receptor. (I) is useful for in vitro diagnosis of illnesses induced by an overexpression or an underexpression of the IGF-IR and/or EGFR receptor is suspected, which involves contacting from a biological sample in which the abnormal present of IGF-IR and/or EGFR receptor is equenc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method for preparing variable region genes of high affinity tumor necrosis factor (TNF) resistent monoclonal antibody (FG mAb). The method comprises using recombinant human TNF immune BALB/c mouse to prepare mouse anti-TNF monoclonal antibody, screening high affinity FG mAb using an indirect enzyme linked immunosorbent assay (ELISA). By cloning the monoclonal antibody light chain and heavy chain variable region (VL and VH respectively) genes, the monoclonal antibody light chain and heavy chain variable region gene sequence and antibody sequence can be obtained, and the unicity of the gene sequence and protein sequence can be confirmed. This sequence represents
DNA fragments related to human immunoglobulin genes - in which are markers for diagnosis of lymphoid tumours by detection of B- and T-type
                                                                                              DH immunoglogulin encoding sequences may be extracted as fragments and used in diagnosis of lymphoid tumours and leukaemias, detecting marker sequences from the VhDhJh gene cluster
                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Variable region gene of high affinity monoclonal antibody of tumor necrosis factor and its preparation.

This invention describes a novel bispecific antibody which can act as a cofactor to enhance an enzyme reaction and can recognize the enzyme and the enzyme substrate. The antibody specifically binds to blood coagulation factor VIII. The invention a ki useful in preventing and/or treating bleeding associated with a disorder or from a disease caused by bleeding. The composition includes blood coagulation factor VIII. The antibody of the invention can be a blood-coagulation fibrinolysis related factor including blood-coagulation factor VIII, blood coagulation factor X, or blood-coagulation factor IX. The antibody comprises a complementary determining region (CDR) of anti-blood-coagulation is useful for preventing antibody. The novel antibody or composition is useful for preventing and/or treating a disease accompanying bleeding, or the disease resulting from bleeding develops and/or progresses by an active reduction or deletion of the blood coagulation factor VIII. The disease the develops and/or progresses by an active reduction or deletion of the blood coagulation factor VIII. The disease the develops and/or progresses by an active reduction or deletion of the blood coagulation factor VIII and/or activation blood coagulation factor VIII, is hemophilia A. This sequence represents a tragment of the antibody described in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but the wint of the brood or sequence of the blood coagulation the method of the invention. Note: The sequence for this patent did not form part of the printed specification, but the blood or the printed specification, but the blood or the printed specification, but the thin the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Score 29; DB 9; Length 6;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a new antibody that immunospecifically binds a Toll-like receptor 4 (TLR4)/MD-2 complex which inhibits 1 lippopolysaccharide (LPS)-induced LL-8 production in human TLR4/MD-2 transfected HEK293 cells. The antibody that immunospecifically binds a Toll-like receptor 4 (TLR4)/MD-2 complex is useful in preparing a composition for alleviating a symptom of a pathology associated with acherrant TLR4 signaling, such as sepsis, ventilator-induced lung injury, acute inflammation, chronic inflammation or autoimmune disorders induced by endogenous soluble stress factors, e.g., allergic condition, asthma, inflammatory bowel disorder, atherosclerosis, osteoarthritis or rheumatoid arthritis. The present sequence represents the amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    rheumatoid arthritis. The present sequence represents the amino acid sequence of a Toll-like receptor 4 (TLR4)/MD-2 antibody 15C1 heavy chain

The invention comprises a cell adhesion modulating agent that modulates desmosomal cadherin-mediated cell adhesion. The cell adhesion modulating agent comprises a Trp-containing cell adhesion recognition (CAR) sequence of a desmosomal cadherin molecule. The cell adhesion modulating agent of the invention is useful for: inhibiting cancer metastasis, inhibiting can angiogenesis in a mammal, ameliorating a demyelinating neurological disorder in a mammal, medilorating and emyelinating neurological cargiogenesis in a mammal, increasing vasopermeability in a mammal, preventing pregnancy in a mammal, increasing vasopermeability in a mammal, preventing cargiorating synaptic stability in a mammal, simulating blood vessel captacing inhibiting stability in a mammal, enhancing blood flow to a tumour in a mammal, disrupting neovasculature in a mammal, inhibiting endometriosis in a mammal, consorved, and for ameliorating appinal cord injury in a mammal. The cougrowth, and for ameliorating a spinal cord injury in a mammal. The cougrowth, and for ameliorating a spinal cord injury in a mammal. The cell adhesion modulating agent of the invention is useful for treating disease conditions that are dependent on angiogenesis and neovascularisation (e.g. psoriasis, diabetic retinopathy or dermatitis).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Cell adhesion modulating agent that modulates desmosomal cadherin-
mediated cell adhesion, useful for inhibiting cancer metaetasis,
comprises Trp-containing cell adhesion recognition sequence of desmosomal
cadherin molecule.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The invention comprises a cell adhesion modulating agent that modulates desmosomal cadherin-mediated cell adhesion. The cell adhesion modulating agent comprises a Trp-containing cell adhesion recognition (CAR) sequence of a deemosomal cadherin molecule. The cell adhesion modulating agent of the invention is useful for: inhibiting a demyelinating neurological anadogenesis in a mammal, ameliorating a demyelinating neurological disorder in a mammal, modulating system of a mammal, preventing pregnancy in a mammal, increasing vasopermeability in a mammal, preventing confibiliting system of a mammal, confidence in a mammal, confidence in a mammal, increasing blood flow to a tumour in a mammal, disrupting neovosculature in a mammal, inhibiting endometriosis in a mammal, containing inhearing adhesion of a contaroing inhelated compound delivery in a mammal, enhancing adhesion of a contaroing inhearing agent of the invention is useful for treating dlease conditions that are dependent or angiogenesis and neovascularisation (e.g. psoriasis, diabetic retinopathy or dermatitis).

The present amino acid sequence represents a Trp-containing CAR sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cell adhesion modulating agent that modulates desmosomal cadherin-
mediated cell adhesion, useful for inhibiting cancer metastasis,
comprises Trp-containing cell adhesion recognition sequence of desmosomal

The invention comprises a cell adhesion modulating agent that modulates Disclosure; SEQ ID NO 16; 507pp; English.

demonsorial cadherin-mediated cell adhesion. The cell adhesion modulating agent comprises a Trp-containing cell adhesion recognition (CAR) sequence of a desmosomal cadherin molecule. The cell adhesion modulating agent of the invention is useful for: inhibiting cancer metastasis, inhibiting cancer in a mammal, ameliorating a demyelinating neurological disorder in a mammal, modulating immune system of a mammal, preventing pregnancy in a mammal, increasing vasopermeability in a mammal, preventing pregnancy in amammal, increasing vasopermeability in a mammal, corpression, increasing blood flow to a tumour in a mammal, createsion, increasing blood flow to a tumour in a mammal, createsion in a mammal, inhibiting endometriosis in a mammal, createsing neovasculature in a mammal, inhibiting endometriosis in a mammal, createsing disconting decine control of a foreign infaled compound delivery in a mammal, enhancing dhesion of a foreign modulating agent of the invention is useful for treating calesaes conditions that are dependent on angiogenesis and neovasculaties of sequence represents a Trp-containing CAR sequence

The invention comprises a cell adhesion modulating agent that modulates desmosomal cadherin-mediated cell adhesion. The cell adhesion modulating agent comprises a Trp-containing cell adhesion recognition (CAR) sequence of a desmosomal cadherin molecule. The cell adhesion modulating agent of the invention is useful for: inhibiting cancer metastasis, inhibiting and an ammal, medulating admentance of a mammal, increasing wasopermeability in a mammal, preventing pregnancy in a mammal, increasing vasopermeability in a mammal, corpression, increasing blood flow to a tumour in a mammal, corpression, increasing blood flow to a tumour in a mammal, corpression, increasing blood flow to a tumour in a mammal, corpression in a mammal, inhibiting endometriosis in a mammal, corpression in a mammal, corpression in a mammal, corpression, increasing delivery in a mammal, enhancing adhesion of a controwth, and for ameliorating a spinal cord injury in a mammal. The cell adhesion modulating agent of the invention is useful for treating disease conditions that are dependent on angiogenesis and neovascularisation (e.g. psoriasis, diabetic retinopathy or dermatitis). The present amino acid sequence represents a Trp-containing CAR sequence of the invention.

The invention comprises a cell adhesion modulating agent that modulates desmosomal cadherin-mediated cell adhesion. The cell adhesion modulating desmosomal cadherin-molecule. The cell adhesion modulating agent of a desmosomal cadherin molecule. The cell adhesion modulating agent of a desmosomal cadherin molecule. The cell adhesion modulating agent of the invention is useful for: inhibiting a demyelinating neurological angiogenesis in a mammal, mentiorating a demyelinating neurological clisorder in a mammal, medulating inamune system of a mammal, preventing pregnancy in a mammal, increasing vasopermeability in a mammal, preventing controling increasing blood flow to a tumour in a mammal, disrupting neovasculature in a mammal, inhibiting endometriosis in a mammal, controling adhesion of a contacting inhaled compound delivery in a mammal, enhancing adhesion of a contactory and for ameliorating agent of the invention is useful for treating disease conditions that are dependent on angiogenesis and cervatitis).

The present amino acid sequence represents a Trp-containing CAR sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Cell adhesion modulating agent that modulates desmosomal cadherin-
mediated cell adhesion, useful for inhibiting cancer metastasis,
comprises Trp-containing cell adhesion recognition sequence of desmosomal
                                                                                                                                                                                                                      pregnancy prevention; vasopermeability; synaptic stability; blood vessel regression; neurite outgrowth; spinal cord injury; angiogenesis; neovascularisation; psoriasis; diabetic retinopathy;

Monoclonal antibodies which inhibit type II phospholipase A2 are useful in the treatment of myocardial infarction, cerebral infarction, acute findney failure, chronic rheumatism, carciac shock, pancreatitis, adult respiratory distress syndrome and colitis. The antibodies were generated by immunising Balb/C mice with recombinant human type II phospholipase A2 Sphen cells from the mice were fused with mouse myeloma byun companient (PaxGAAGS.U) and the hybridomas obtained were screened for phospholipase A2 inhibitory activity. Active clones were isolated including 12HS, 1.4 and 10.1. These were cultured and the antibody isolated from the culture upernatant by precipitation with ammonium sulphate and purification on a column of protein A-Sepharose CLAB. Because the antibody acts on the precipital testing. This peptide sequence corresponds to the first complementary determining region of the heavy chain of the monoclonal antibody isolated from the clone designated 1.4
                                                                                                                                                                Monoclonal antibody; phospholipase; myocardial infarction; pancreatitis; cerebral infarction; acute kidney failure; colitis; chronic rheumatism; adult respiratory distress syndrome; cardiac shock; treatment; preclinical testing; disease; hybridoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Monoclonal antibody inhibiting type II phospholipase A2 activity - for treatment of myocardial and cerebral infarction.

The chimeric Abs can be used both in vivo and in vitro and, since they have very low immunogenicity as compared with mouse Abs, they can be administered to humans for diagnostic and therapeutic purposes. They are also more stable and show a longer half-life in the blood as compared with the original mouse Abs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Chimeric monoclonal antibodies - contain anti-human fibrin antibody light and heavy chain variable and constant for treating thrombotic conditions e.g. myocardial infarction.

                                                                                                                                                                                                                                                                                                                                                 Sucrose-fructan 6-fructosyl transferase, isolated from barley (Hordeum vulgare), is a key enzyme for the biosynthesis of franched fructans which are typical for grasses 6-SFT comprises 2 subunitafisoforms of 49 and 23 kDA resp. . The enzyme forms Kestose from sucrose and bifurcose from sucrose and isokestose. Transgenic plants contg. the cDNA can be used for the prodn. of oligosaccharides that have more desirable properties compared with the oligosaccharides prepared by known industrial processes. An advantage of the method is that the chain length distribution is narrower, with no or few free sugars occuring in the end product. This means lower cariogenicity and lower energy value. The present sequence is that of the N-terminal of the 6-SFT 49 kba subunit. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                           use as sugar

AAM39848-50 represent the sequences of the heavy chain complementarity determining regions (CDRs) of the catalytic antibody 2A10, which is able to degrade cocaine. A series of cocaine transition state analogues (TSAs) were prepared and used to immunise mice for production of hybridomas. Catalytic antibodies were identified by their capacity to release 3H-benzoic acid from 3H-phenyl cocaine. The 2A10 antibody was identified using TSA1, which is an immunogenic conjugate of a phosphate monoester transition state analogue. Antibody SA10 has a per minute Kcat of 0.011. The antibodies reduce the concentration of cocaine in a subject, and are used particularly for the treatment of an overdose. They are also used for treating addiction (by reducing the in vivo concentration that can be
                                                                                                                                                                                                                                                                                                                                                                   New catalytic antibodies able to decompose cocaine, single-chain analogues - used to treat cocaine overdose and addiction, required in far smaller doses than antibodies that antagonise cocaine by simply binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 15; Page 89; 147pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DEVELOPMENTAL STAGE: First appears in the ovarian follicles furing vitellogenesis. Accumulates in the occytes before being secreted during fertilization. Expression continues in the embedded occyte. Accumulates in the egg capsule after fertilization.

MASS SPECTROMETRY: MW=596.6; METHOD=MALDI; RANGE=1-6; NOTE=Ref.1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Eukaryotā; Metazoa; Arthropoda; Hēxapoda; Insecta; Pterygota;

-!- FUNCTION: Activates the expression of the trpBA genes encoding two tryptophan synthase subunits. In the absence of the inducer (indoleglycerol phosphate), trpI binds upstream of the trpAB operon, overlapping its own promoter region.

-!- SIMILARITY: Contains 1 HTH lysR-type DNA-binding domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Eukaryota, Viridiplantae, Streptophyta, Embryophyta, Tracheophyta, Spermatophyta, Magnoliophyta, eudicotyledons, core eudicotyledons, Caryophyllales, Amaranthaceae, Spinacia.
